PROJECTS

self driving car using deep learning.

- python program is the machine learning model which built using deep neural network.
- With the help KERAS built the model.
- CNN network captured head roads and stop signs. .
- Utilized supervised learning methods such as data augmentation to increase accuracy and feed forward with Inputs being the images from video collection and outputs being lane keeping/steering decisions.
- Developed the model accuracy with validation data set up to 0.96 and visualized the learning curves.

Emoji Detection

- Developed mobile-friendly algorithm for facial expression detection and recognition that achieved 90% accuracy in identification of 22 different human emojis.
- Constructed database composed of over 20,000 facial expressions for testing and trained model through supervised learning methodologies to improve accuracy.
- Created automated tools leveraging Python and OpenCV libraries to classify dataset and produce labeled images for testing.
- Utilized Convolutional Neural Networks (CNNs) to classify emojis with 90% precision.

EDUCATION

Bachlor of Technology

AKTU • Lucknow • 2021

CERTIFICATIONS

Data science training by NASSCOM

Department of Computer Science, BHU varanasi

SKILLS

Soft Skills: Data Science, Machine Learning, Natural Language, Python
