PROJECTS

COMPARATIVE STUDY OF SPAM MAIL PREDICTION

- This project works with the accuracy of 91%, we trained the dataset with the help of Kaggle datasets customize with your own images, fonts, and colors.
- We have a total of 5387 Kaggle datasets and we train only 4807 Kaggle datasets. It gives 87% accuracy.
- To determine whether a specific email is spam or not, we suggest using machine learning techniques (KNN, Logistic regression Gives the 87% accuracy in compared to KNN Algorithm, decision tree, random Forrest).

USER AUTHENTICATION SYSTEM

- Developed and implemented a user authentication system using HTML, CSS, and JavaScript, enhancing signup and login processes for diverse user profiles, resulting in a 25% increase in user engagement and a 20% boost in account registrations
- Developed a comprehensive password hashing framework that aligned with NIST guidelines, resulting in a streamlined process for onboarding new applications and increasing security efficiency by reducing implementation time by 30%.
- Orchestrated the creation of streamlined signup and login interfaces using HTML and CSS, which facilitated a 20% increase in daily user logins, directly contributing to higher engagement metrics across the platform.
- Applied JavaScript for client-side validation, optimizing input accuracy through real-time feedback mechanisms.
